Trampoline Install

March 18, 2013

Users are not allowed to do system-wide installations of software on Mac OS X computers of ECN. So before using Trampoline, you have to install it in your home directory.

1   Trampoline

1. Go in your home directory if you are not already in it: `cd`

2. Download the package from here: `http://www.irccyn.ec-nantes.fr/~bechenne/trampoline-isis`

3. Uncompress it in your home: `tar xvzf trampoline.tgz`

2   Goil and miscellaneous

Goil is the OIL compiler.

1. Go back in your home: `cd`

2. Create a bin directory in your home: `mkdir bin`

3. Go in the goilv2 makefile directory: `cd trampoline/goilv2/makefile-macosx`

4. Build it: `make goil`

5. Put it in bin: `mv goil ~/bin`

6. Edit your .profile in your home or create it if it does not exist and add the following lines at the end: `export PATH=$PATH:~/bin`. Add the path of the templates for goil: `export GOIL_TEMPLATES=~/trampoline/goilv2/templates`.

7. Update your environment: `source ~/.profile`

8. Test goil is working: `goil --version` should print `goil :  version 2.1.3`
